Ajay Surya Senthilrajan

Document AI. Retrieval. Evaluation.

Target: Senior AI / GenAI Engineer | Bengaluru first, Chennai second | Immediate availability

PROJECT OWNERSHIP AT REDICA SYSTEMS

Owned a document-intelligence project spanning OCR, structured extraction, retrieval and service integration. The work includes page-level quality checks, controlled OCR retries and explicit review signals for unreliable content.

Formal role: Data Engineer II (MLE), July 2024-present. Employer implementation and customer material remain private.

TWO PUBLIC PROJECTS TO INSPECT FIRST

ARCI - regression experiments for agents

Compares baseline and candidate behavior under declared tasks and faults. Connects statistical gating, tool/MCP fault injection, failure diagnosis and offline replay.

Inspect: the documented fixture demo, declared experiment and reproduced failure. A passing result is scoped to that experiment; it is not absolute reliability.

github.com/ajaysurya1221/agent-reliability-ci

Actseal - evaluate one fixed action policy

Evaluates accepted-action risk and coverage with exact binomial bounds, applies synthetic provider-fault checks and seals evidence for provider-free replay.

Inspect: the fixed/bad fixture comparison and replay artifacts. Replay checks consistency with recorded evidence; it does not authenticate responses or prove label truth.

github.com/ajaysurya1221/actseal

FURTHER ENGINEERING EVIDENCE

Dorian: checkable code claims and revalidation. **Frontier Scout:** declared pull-request scope verification, with its research-preview limits. **Evalopt Graph:** supplied-evidence acceptance decisions; standalone feature development has ended.

A useful interview discussion: define the acceptance contract, introduce a failure, inspect the evidence, explain the boundary and decide what to test next.

GitHub portfolio | LinkedIn

Prepared 2 November 2026. Public-project fixture demonstrations are bounded evidence, not production certification.
